

ZFrame Mobilization Package for Existing Projects

Mobilize existing studies and applications for local or remote usage, online or offline. Adapts Web applications to support offline data collection on TabletPC's, portable notebooks, or PDA's. Embedded data security, common web standards.

Mobilization Package

- Complete ZFrame technology suite, in the service of mobilizing existing studies, applications or other forms-based database projects. Projects can be mobilized for TabletPC, notebook and/or PDA access, based on existing desktop accessible or paper-based projects. There is no need for parallel development or maintenance. Security issues are tackled both at the specific field level, for protection of patient identifying data, and through secure transmission protocols for all transactions.
- ZFrame LocalWeb™ offline technology enables mobile TabletPC, notebooks or PDA's to capture zAuthor webforms on the local device while operating offline. The filled-out forms are then synced to the server database through a desktop PC or ZFrame wireless PDA server.
- ZFrame Service for full integration and any custom development needed to mobilize database applications or studies. The end result is full and flexible mobilization, creating a common experience from desktop, Tablet or PDA.
